Assessment of sexual-reproductive health in women with severe-moderate psychiatric pathology.

MA Obiol, JC Quilez, ML Lozano, PL Lobo, YM Ramada, AI Iftimi, JR Serrano, RL Lertxundi.

2012-2017
73 women (16-52) years old

- Average age: 31.8
- 35.7% had antecedents of abortion
- 41.6% had children.
- 65.21% were active smokers.
- 41.17% reported previous drug use.
- 68% performed gynecological examinations regularly.

Prevalent psychiatric pathologies

- Schizophrenia (26%)
- Bipolar disorder (20.5%)
- Personality disorders (20.5%)
- Depression (13.6%)
- Hyperactivity disorder with attention deficit (6.8%)
- Obsessive-compulsive disorder (4.1%)
- Anorexia nervosa (4.1%)
- Delinious disorders (2.7%)
- Agoraphobia (1.3%)

Contraceptive methods used

- Condom (36%)
- Withdrawal (27%)
- Copper Intrauterine device (15%)
- Combined oral contraceptive (10%)
- Depot medroxyprogesterone acetate (4%)
- Subdermal implant (4%)
- Progestin-only pill (1.3%)

Contraceptive Counseling

Decrease in the use of low-efficacy methods:
- Condom: from 27% to 10.2%
- Withdrawal: from 15% to 0%

Increase in the use of high-efficacy methods:
- Subdermal implant from 4% to 25%
- Copper IUD: from 15% to 22%
- Levonorgestrel Intrauterine system: from 0% to 5.8%

And...

- Three women requested preconception care
- Three abortion requests were registered
- Three altered cervical swabs were tested
- Two cases of Chlamydia were detected

- Regarding the quality of sexual life
  - 46% expressed a wish to motherhood in the future...
  - 60.3% reported a satisfactory sexual life
  - 37.7% had been victims of domestic violence
All women are equal but some are more equal than others...
And others are less equal.
